SCALE YOUR FACTORY WITHOUT LOSING ITS SOUL

Brief for AI implementation

Your company profile

How to work with this brief

Your answers are the foundation we use to build a proposal for your company: setup architecture, stages, estimated timeline, and cost. The more details you provide where you have something to say, the better we will match your situation. Open-answer fields are optional; fill them only where you have something to add.

Who is filling out the brief

Name

Position

About your company

A few questions so we can understand how your company works.

Number of employees in the company

What departments exist inside the company and how are they structured

Geography of the main brands you work with

Approximate production volume per year (pairs)

How many regular brands are you currently working with

Average order volume per brand (pairs)

Below are the four priority areas of the first layer. For each one — a short context, a question about how relevant it is for you, and space for your comments.

1. Development (R&D Department)

A designer with AI tools builds a technical task from the brand's materials — mood board, descriptions, references, tech pack — and visualizes the future model within 1–2 days. Edits happen at the AI visual stage, not at the physical sample stage.

How relevant is this area for you?

- ☐ Very relevant
- ☐ Interesting, but not right now
- ☐ Not relevant
- ☐ Already works the way we need

What is most valuable to you here? Describe your context, so we can fit the solution to your situation.

Your comments and notes on this area.

2. Order Expansion (Design Department)

After the model is approved, AI tools build dozens of variations in hours: color schemes, upper materials, textures, prints, embossing graphics, detail variations. At the same time — lookbooks for the brand's next collection based on current trends.

How relevant is this area for you?

- ☐ Very relevant
- ☐ Interesting, but not right now
- ☐ Not relevant
- ☐ Already works the way we need

What is most valuable to you here? Describe your context, so we can fit the solution to your situation.

Your comments and notes on this area.

3. Sales and Communication (Sales Department)

AI records and summarizes calls with the brand into a bilingual summary — decisions, agreements, action items. The result of the conversation becomes a working task for design and R&D. Follow-ups, reminders, and draft emails are handled by AI; decisions are made by your managers.

How relevant is this area for you?

- ☐ Very relevant
- ☐ Interesting, but not right now
- ☐ Not relevant
- ☐ Already works the way we need

What is most valuable to you here? Describe your context, so we can fit the solution to your situation.

Your comments and notes on this area.

4. International Marketing (Marketing Department)

Regular English content on Instagram, LinkedIn, Pinterest — lookbooks, product presentations, materials for sourcing directors and designers. Quarterly trend reports in your segment, ready to send to brands. A narrative about processes and the team for supply chain transparency requests.

How relevant is this area for you?

- ☐ Very relevant
- ☐ Interesting, but not right now
- ☐ Not relevant
- ☐ Already works the way we need

What is most valuable to you here? Describe your context, so we can fit the solution to your situation.

Your comments and notes on this area.

Priority of areas

Place the areas that are relevant for you in order of value right now — this will help us build the right sequence of implementation stages. Areas that are not relevant can be skipped.

1. Highest priority

2.

3.

4. Lowest priority (if relevant)

Besides the four priority areas, AI can also be used in other parts of the company. Choose the numbers that are relevant for you and briefly describe your task for each one.

Management tasks

1. AI analytics for the owner and management.

Brings company data into one picture and answers strategic questions at the moment they come up — comparing periods, cuts by brand, model, market — without waiting a week for a report to be prepared by hand.

2. Support for management decisions.

Fast scenario calculations and option comparison for a specific decision, including situations where the decision must be made quickly.

3. Corporate AI assistant based on company knowledge.

Turns company experience, procedures, and internal materials into a working tool that employees can ask for an answer instead of searching by hand or asking colleagues.

4. Scaling the management function.

Takes part of the management routine off the owner and key managers — reports, summaries, execution control — and reduces the company's dependence on individual people.

Your choice

- ☐ 1. AI analytics for the owner and management.
- ☐ 2. Support for management decisions.
- ☐ 3. Corporate AI assistant based on company knowledge.
- ☐ 4. Scaling the management function.

For each chosen number — in one or two sentences, describe your specific task or request.

Example: 2 — we need to calculate scenarios for a specific decision quickly, when the deadline is tight.

Operational tasks

1. Production planning.

Helps build and rebuild the production plan based on deadlines, capacity, and order priorities, reducing the load of manual planning.

2. Work with suppliers and materials.

Gives easy access to information about suppliers, prices, terms, and work history — in one place and always up to date.

3. Purchasing and stock management.

Forecasts material needs and reduces the risks of both obsolete slow-moving stock and shortages of needed items at the wrong moment.

4. Logistics and delivery timing.

Brings all logistics stages of each order into one picture — from shipment from the factory to acceptance by the buyer — and gives early warning about delivery risks while there is still time to act.

Your choice

- ☐ 1. Production planning.
- ☐ 2. Work with suppliers and materials.
- ☐ 3. Purchasing and stock management.
- ☐ 4. Logistics and delivery timing.

For each chosen number — in one or two sentences, describe your specific task or request.

Example: 1 — our production schedule is rebuilt manually every week; we lose time and miss deadlines.

Data and knowledge work

1. Documentation and procedures.

Helps describe processes the way they really work in the company and keep procedures up to date in the normal work rhythm.

2. Employee onboarding.

An AI assistant based on company knowledge reduces the time new employees need to reach a working level and reduces the load on mentors.

3. Regular management reporting.

Automates report collection across departments, data aggregation, and preparation of regular formats for the management team — weekly, monthly, and at period close.

4. Client base analytics.

Segments brands by profitability, stability, and future potential, and gives a clear view of which brands are worth deeper work and where terms should be reviewed.

Your choice

- ☐ 1. Documentation and procedures.
- ☐ 2. Employee onboarding.
- ☐ 3. Regular management reporting.
- ☐ 4. Client base analytics.

For each chosen number — in one or two sentences, describe your specific task or request.

Example: 4 — we don't understand which brands bring real profit and which ones consume resources — we need cuts by profitability and stability.

Next step

Based on your answers, we, **balance aigency**, will prepare a proposal and an implementation plan: the implementation architecture for your company, work stages, estimated timeline, and cost of collaboration.

Email: **db.pabloli@gmail.com**

WeChat ID: **db_pabloli**

Proposal turnaround: within **5-7 working days** after we receive the completed brief, we will come back with a proposal and an implementation plan.
